Institute Collaborator Portal

Milestone 2 Delivery — Admission System · Waga C, Pronto Digital · September 2026

Milestone 1 built the foundation and the locked front door. Milestone 2 opens it. A person can now reach the Institute by three routes, be judged once, and become an admitted collaborator, with every step recorded and nothing happening to anybody before the Institute decides it should. It is delivered running on the Institute's own infrastructure, and every screenshot in this report was taken from the live system, not from a mock-up.

1. What was delivered

Committed for Milestone 2	Status
Website application form	**Delivered — public, no account needed, with the applicant told plainly that a person will read it**
Referral form for collaborators	**Delivered — including the relationship question agreed on 27 August, seen by the Institute alone**
Administrative review queue	**Delivered — one list, oldest first, so nobody waits longest merely because they arrived by a different route**
Four review actions	**Delivered — Approve, Need more information, Set aside, Decline, with only the first and last recorded as judgements**
Invitation lifecycle	**Delivered — unique, single-use, expiring, revocable, reissuable, by email or by copied link**
Registration and the admission record	**Delivered — the invited person confirms their own details; admission, provenance and consent are recorded permanently**
Consent	**Delivered — recorded at registration against the privacy notice version in force at that moment**
Up to three positions per collaborator (approved addition, Item 1)	**Structural work delivered — the limit of three is enforced by the database itself; the entry screens arrive with Milestone 3 as agreed**

2. The decisions this milestone implements

Each of these was agreed in writing during August, and each is now enforced by the software rather than remembered by whoever is working on it.

Four actions, of which only two are judgements

Approve and Decline are recorded permanently. **Need more information** is a question: it keeps the case open and may be asked more than once. **Set aside** is a silent pause that stays in the queue, because a case that disappears when paused is a case that gets forgotten. A candidate who is questioned twice and then approved appears in the record as *one* decision, not three.

Issuing an invitation is deliberately not among the four. It is a consequence of approval, so it appears only after approval and never as a fifth way of judging someone.

Who the Portal may contact, and when

On a referral, a question goes to the **referrer**, never to the person recommended. Until the Institute approves them they are being discussed, not dealt with, and they may not know the conversation is happening at all. Set aside and Decline send nothing to anybody. The referrer is told once, and only once: when an invitation has been issued. They are never told about a decline.

The invitation link survives being scanned

LinkedIn and Outlook open links to inspect them before a person ever clicks. An invitation consumed on opening would therefore be spent by a machine, and the real recipient would meet a dead link. Opening changes nothing here; only a completed registration spends the invitation. This is demonstrated below, opened three times before use.

The link is shown once

Only a cryptographic hash of the invitation is stored, so there is no page anywhere — including that one, on a refresh — that can display the link again. Losing it is not a problem: issuing a fresh link is one click and retires the old one at the same moment.

One person, one case, one decision

Somebody may apply unprompted while a collaborator independently recommends them. Both submissions are kept, because each carries something the other lacks, and the Portal suggests that they may be the same person. It never joins them by itself. A shared

email address is strong evidence and a shared name is weak, but neither is proof, and a wrongly joined pair of people is far harder to repair than an unjoined one.

Names and titles are never abbreviated by the software

First, middle, family and preferred names allow 100 characters each; organisations and departments 200; professional titles 300. They are counted in characters rather than bytes, so a Lithuanian or Chinese name receives exactly the same allowance as an English one. Whatever is accepted is displayed in full, wrapped onto further lines, and never truncated. The evidence below shows a 187-character named chair displayed whole.

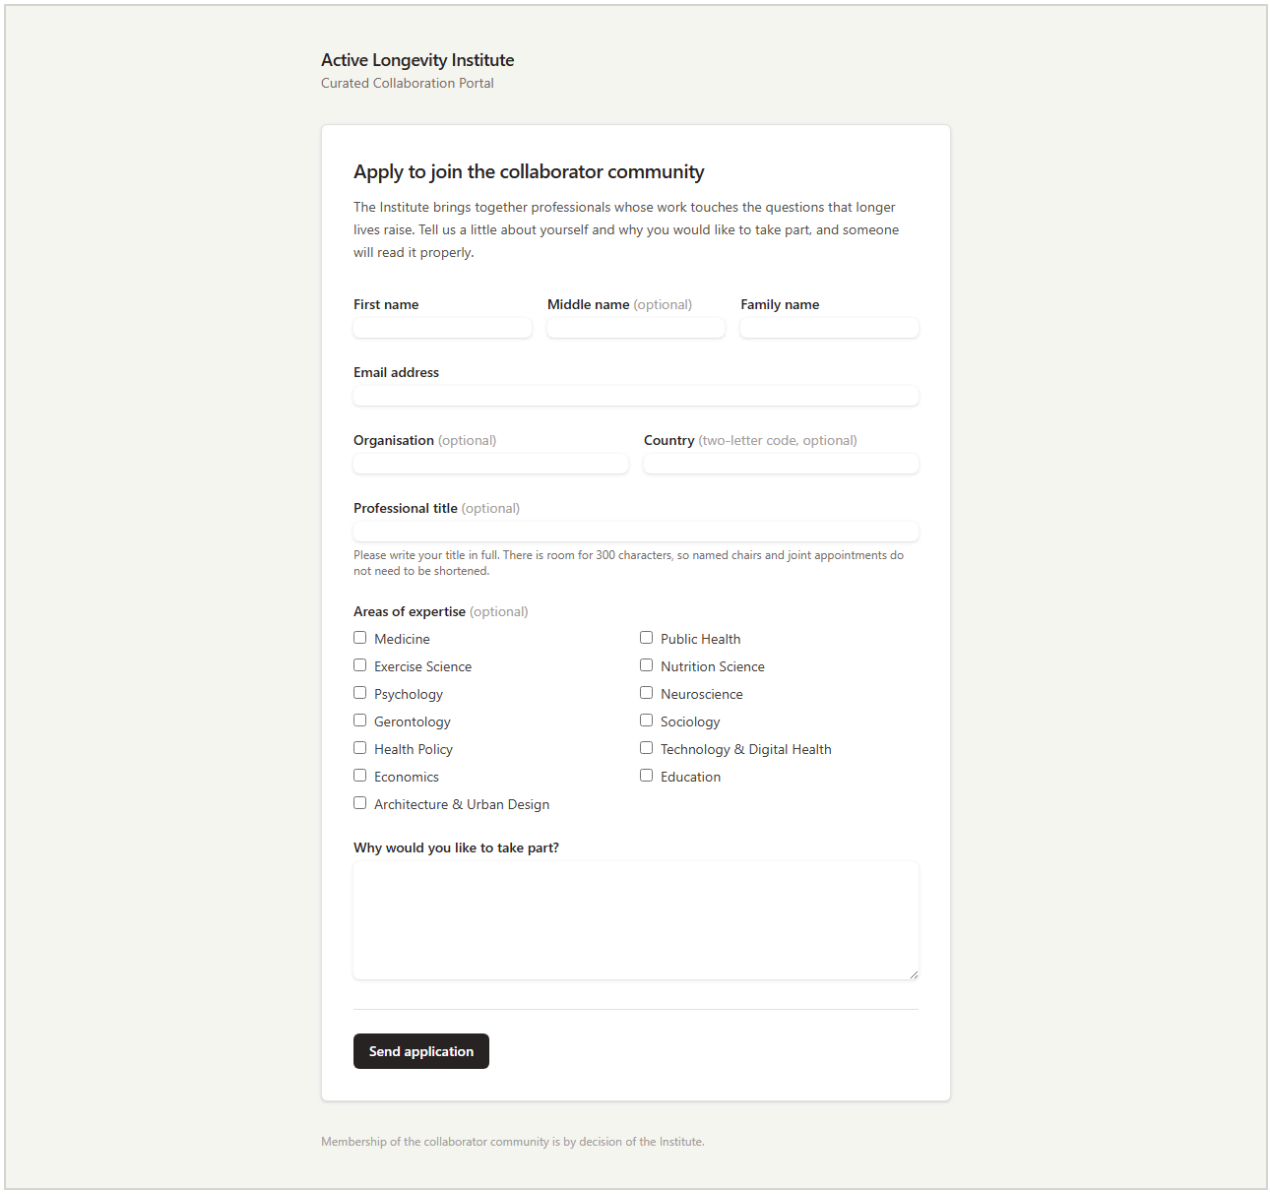

How the Portal addresses people

One rule, written once, used by every message and by the Portal itself: the preferred name if one was given, otherwise the first name, otherwise a courteous greeting with no name at all. That last step matters — before registration the Portal may hold only what was typed, and it must never send "Hello ,".

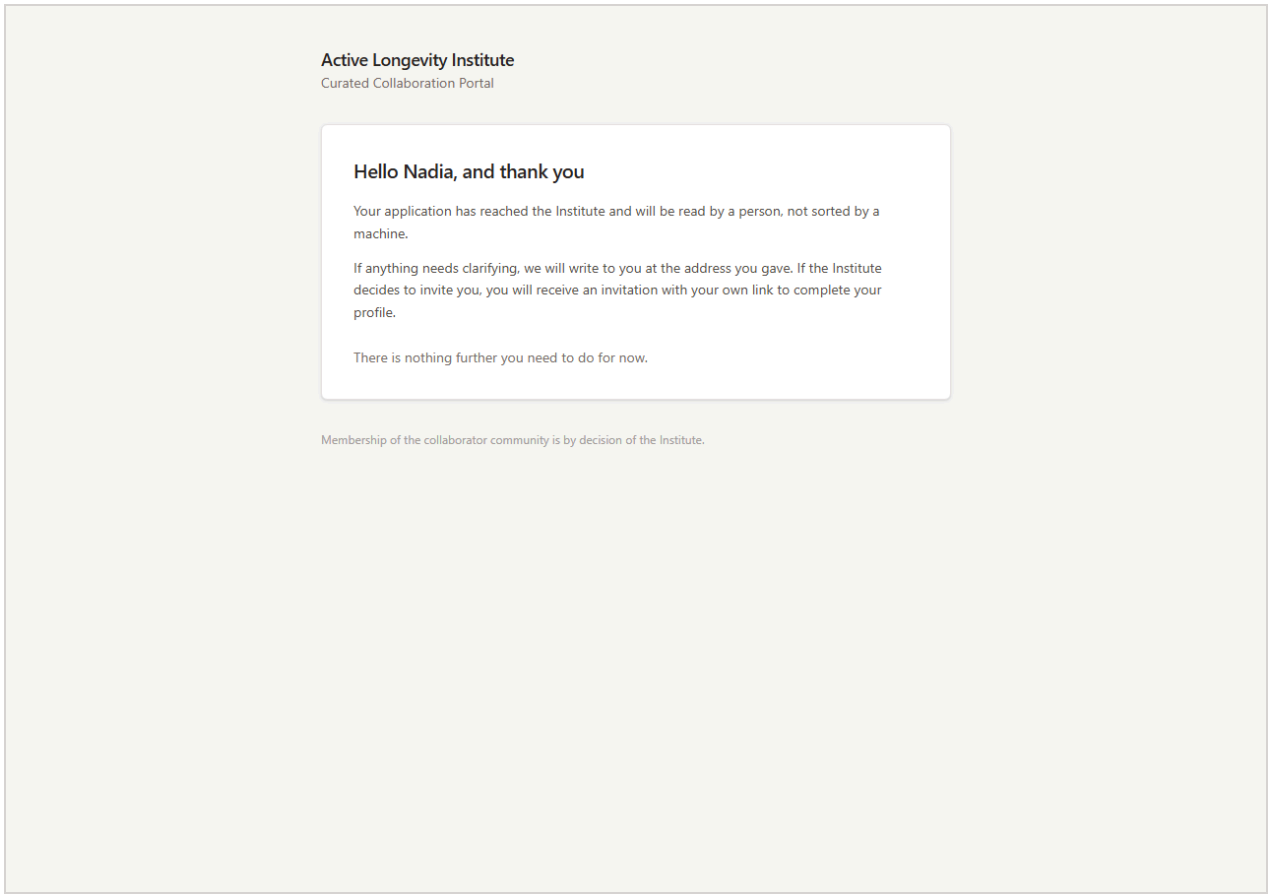

3. The walkthrough

A recorded walkthrough accompanies this report: `video/M2-Walkthrough.mp4`, seven minutes, with subtitles. It follows one person the whole way in, from the form on the website to an admitted collaborator, and it was recorded against the live staging system rather than staged. Subtitles are shown on screen, and are also supplied separately as `.srt` and `.vtt` should you wish to use them elsewhere.

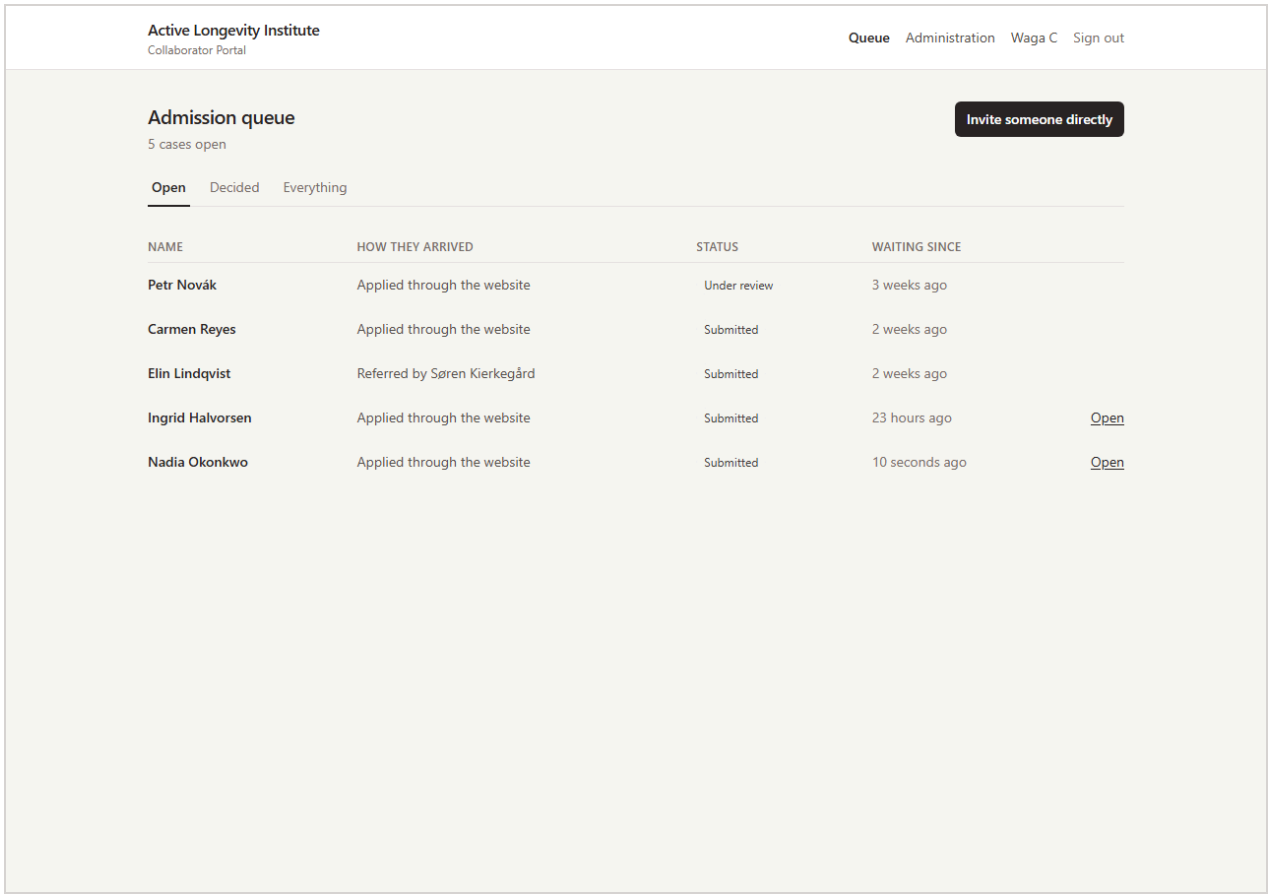

4. Evidence, from the live system

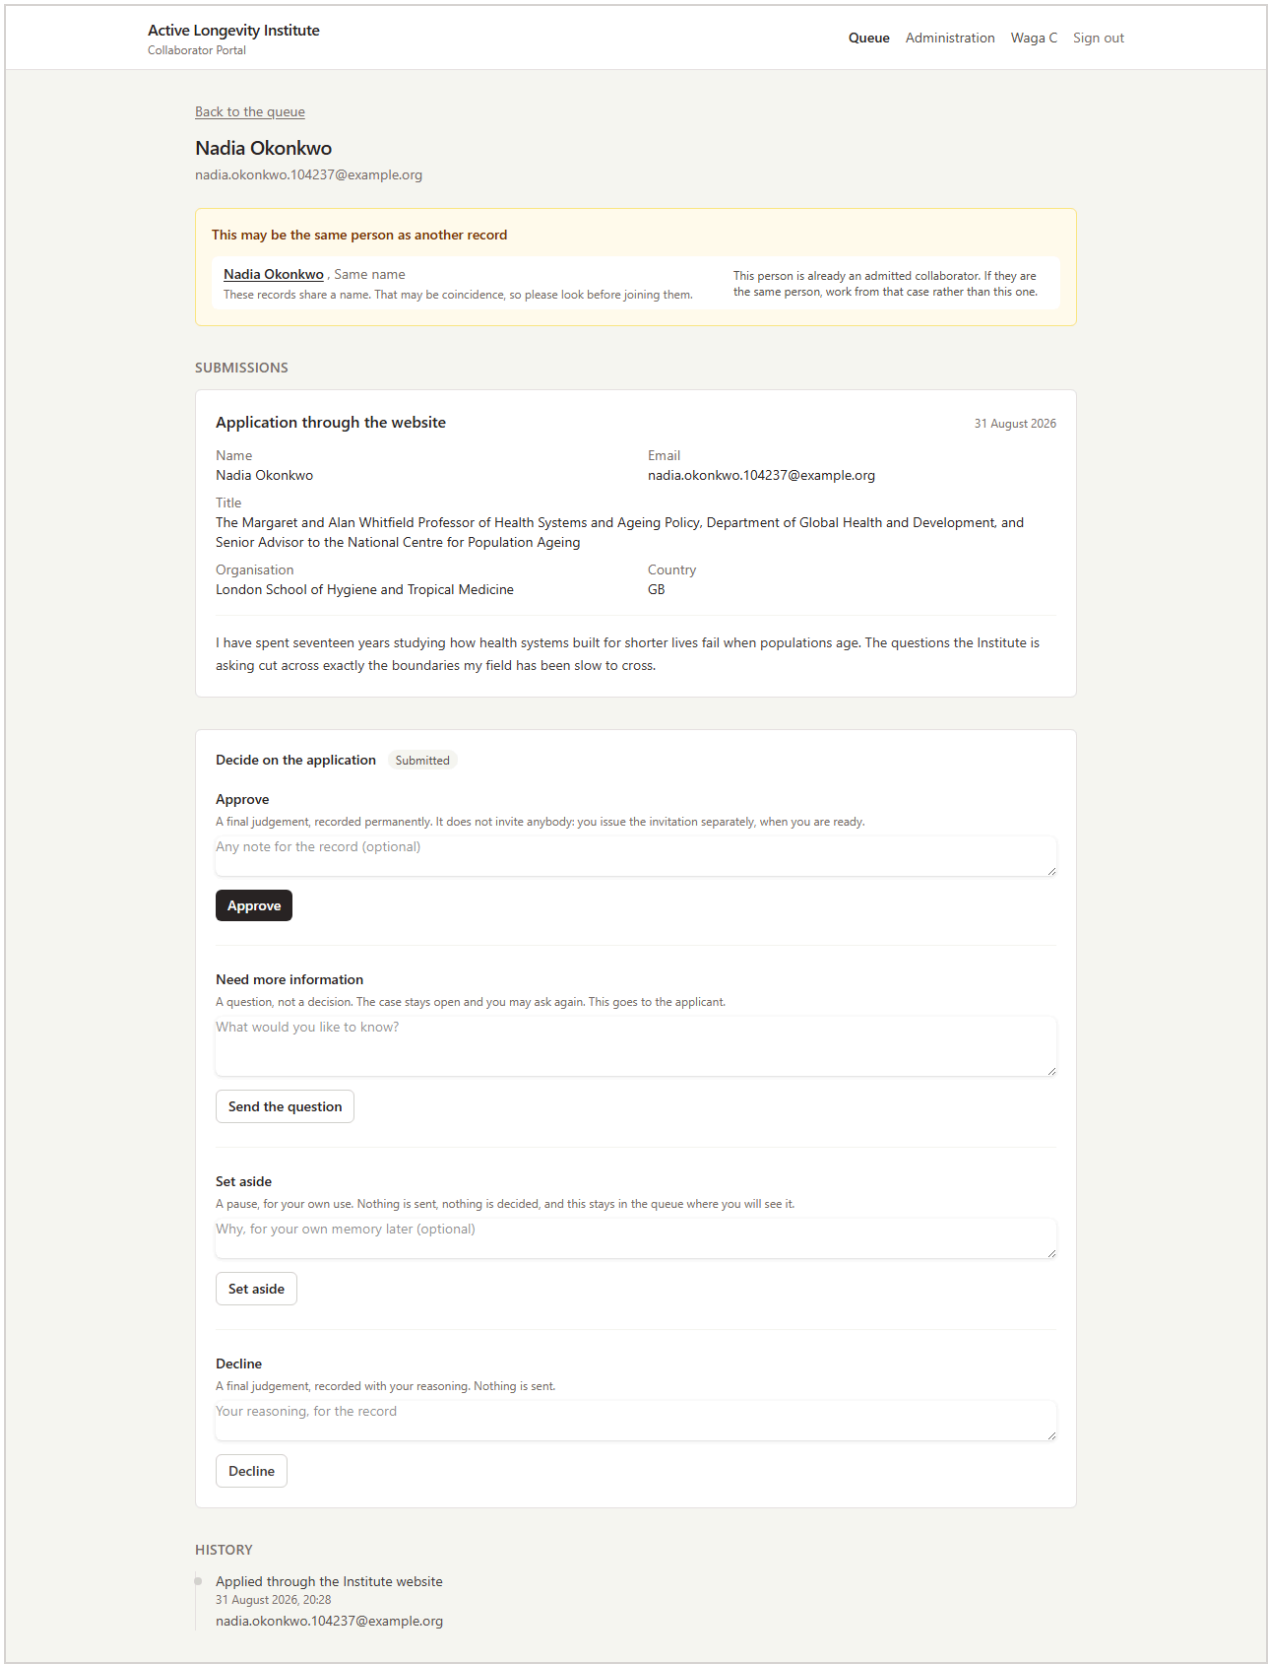

The public application, as a stranger meets it. The note under the title field exists because people abbreviate their own titles when they suspect a form will not accept the whole thing.

The confirmation. It promises only what the Institute can honour: that a person will read it. No date is invented.

The review queue. Applications and referrals in one list, oldest first.

The case, and the four actions. Note the 187-character named chair displayed in full, and that each action states its own consequence before it is taken.

Your question has gone to the applicant.

This may be the same person as another record

Nadia Okonkwo , Same name
These records share a name. That may be coincidence, so please look before joining them.

This person is already an admitted collaborator. If they are the same person, work from that case rather than this one.

SUBMISSIONS

Application through the website

31 August 2026

Name
Nadia Okonkwo

Email

Title
The Margaret and Alan Whitfield Professor of Health Systems and Ageing Policy, Department of Global Health and Development, and Senior Advisor to the National Centre for Population Ageing

Organisation
London School of Hygiene and Tropical Medicine

Country
GB

I have spent seventeen years studying how health systems built for shorter lives fail when populations age. The questions the Institute is asking cut across exactly the boundaries my field has been slow to cross.

Decide on the application Awaiting information

Approve

A final judgement, recorded permanently. It does not invite anybody: you issue the invitation separately, when you are ready.

Any note for the record (optional)

Approve

Need more information

A question, not a decision. The case stays open and you may ask again. This goes to the applicant.

What would you like to know?

Send the question

Set aside

A pause, for your own use. Nothing is sent, nothing is decided, and this stays in the queue where you will see it.

Why, for your own memory later (optional)

Set aside

Decline

A final judgement, recorded with your reasoning. Nothing is sent.

Your reasoning, for the record

Decline

ASKED 31 AUGUST 2026
Which of your appointments is current, and since when?

- More information asked of the applicant
  31 August 2026, 20:28 · Waga C

Which of your appointments is current, and since when?

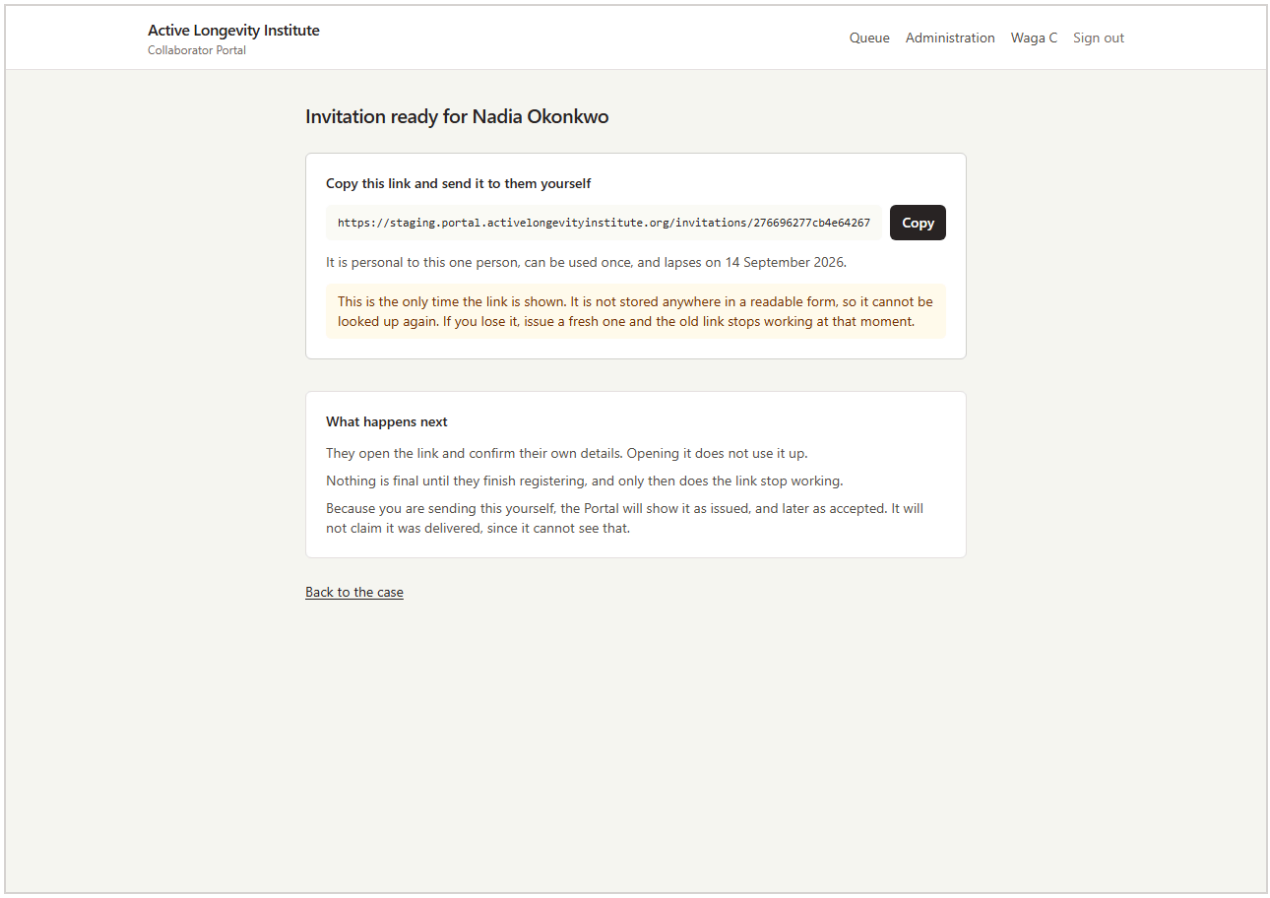

After asking a question. The case reads "Awaiting information" and remains open. No decision has been recorded, and the question may be asked again.

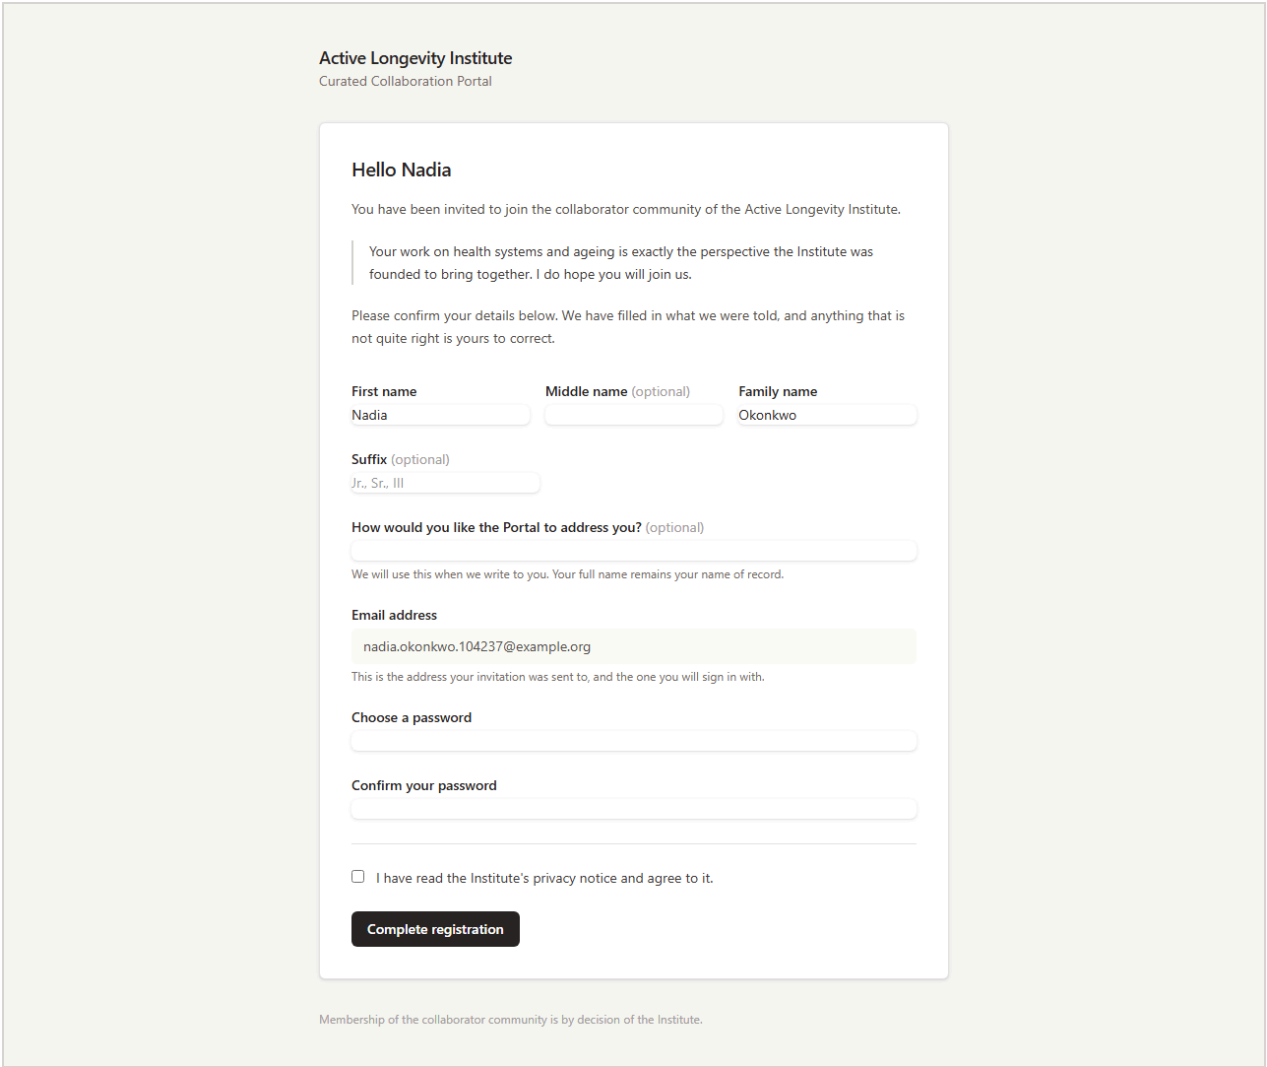

After approval. An invitation is now *offered*, separately. Approving did not invite anybody.

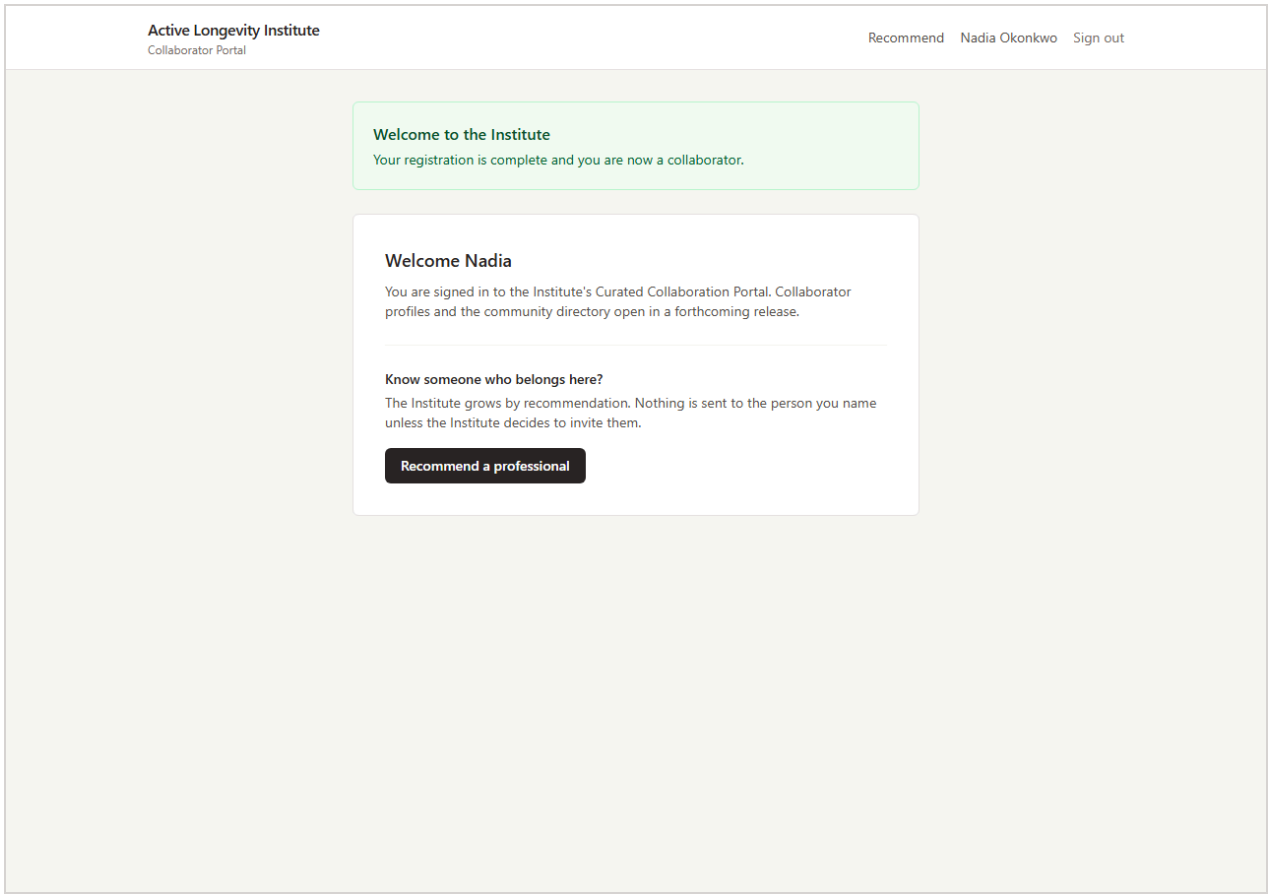

The invitation form. A name is all that is required, because many of these relationships begin on LinkedIn where the Institute has no email address at all.

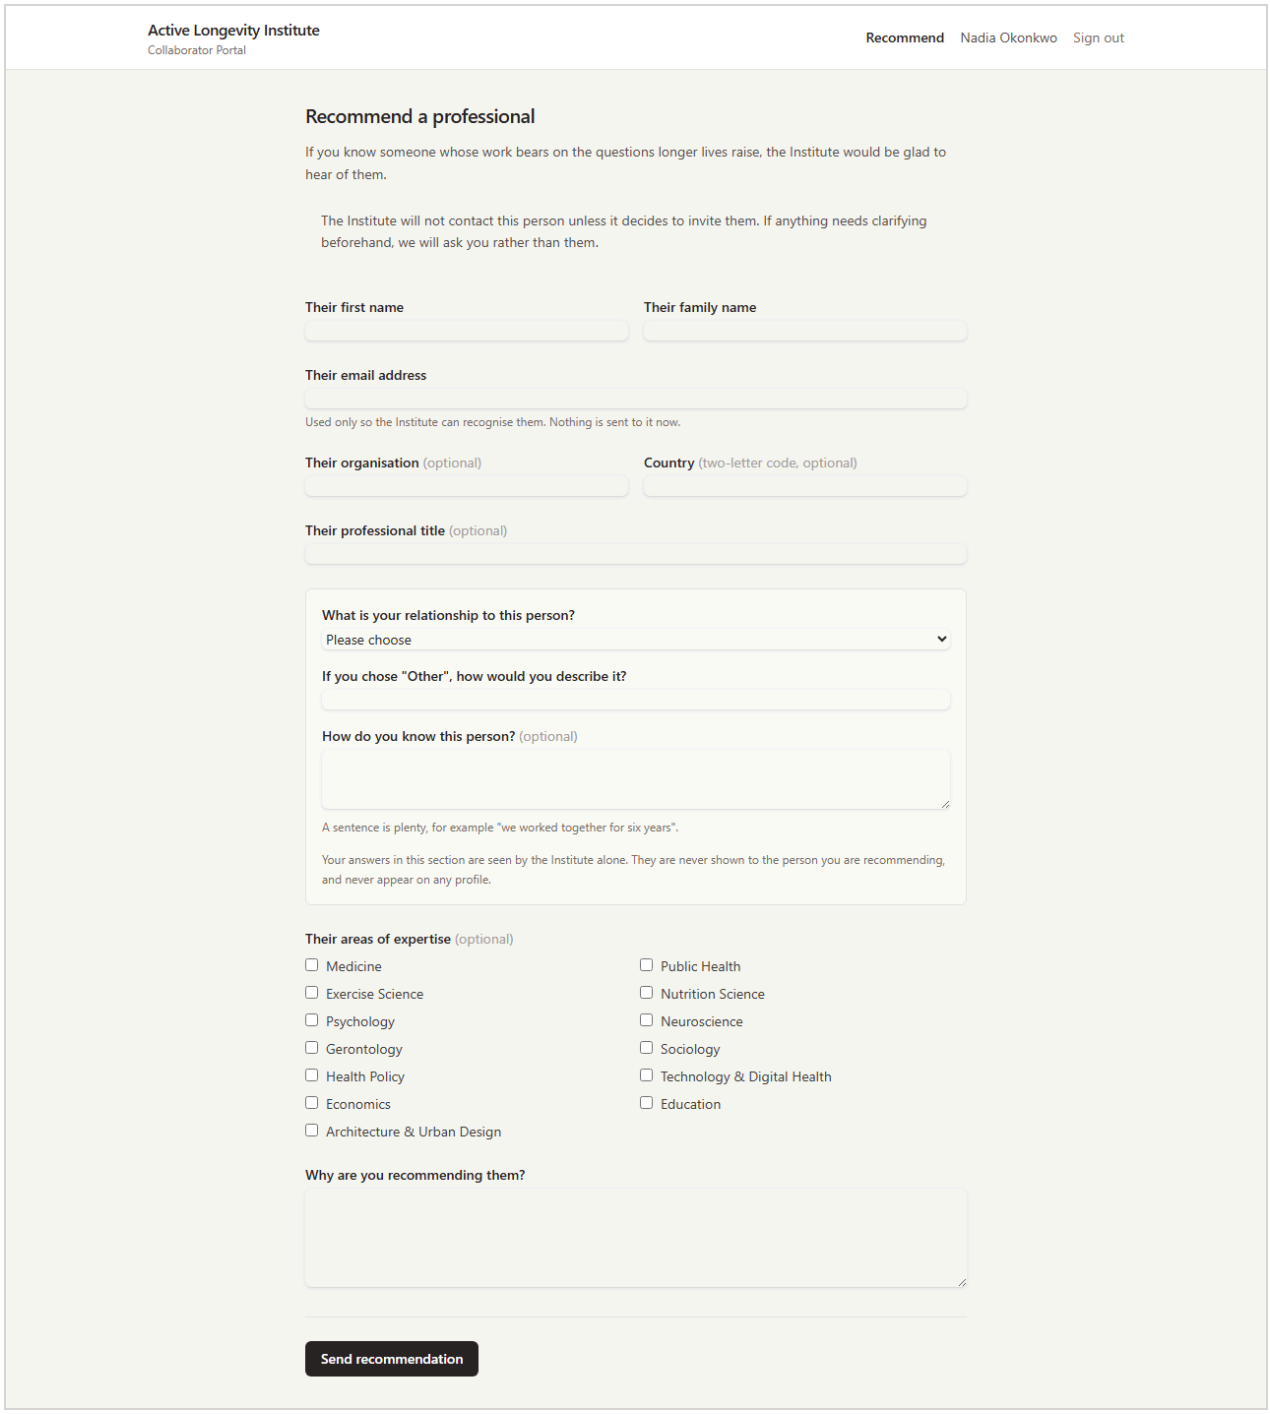

The link, shown once. The Portal states plainly that it cannot be displayed again, and what to do instead.

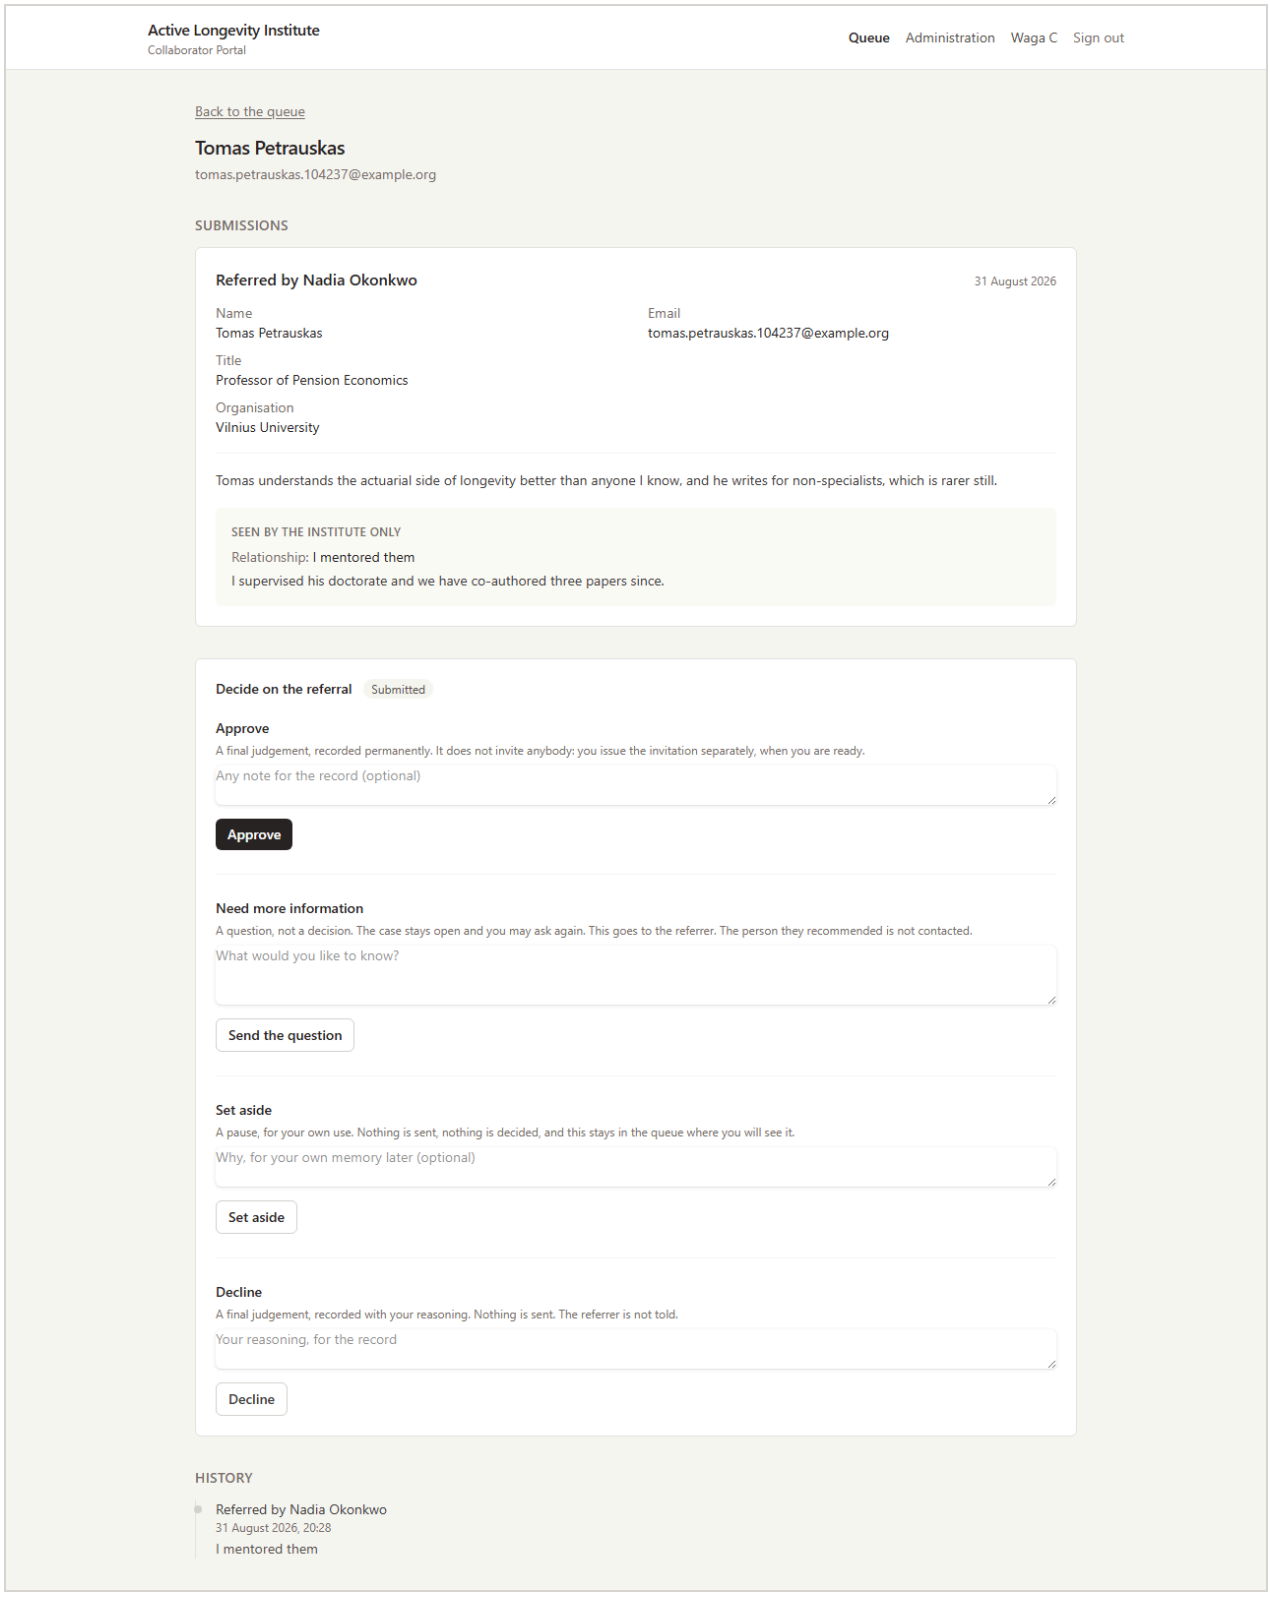

The registration page, after the link had already been opened three times — as a link scanner would. The invitation is intact. The personal sentence from the Institute appears above.

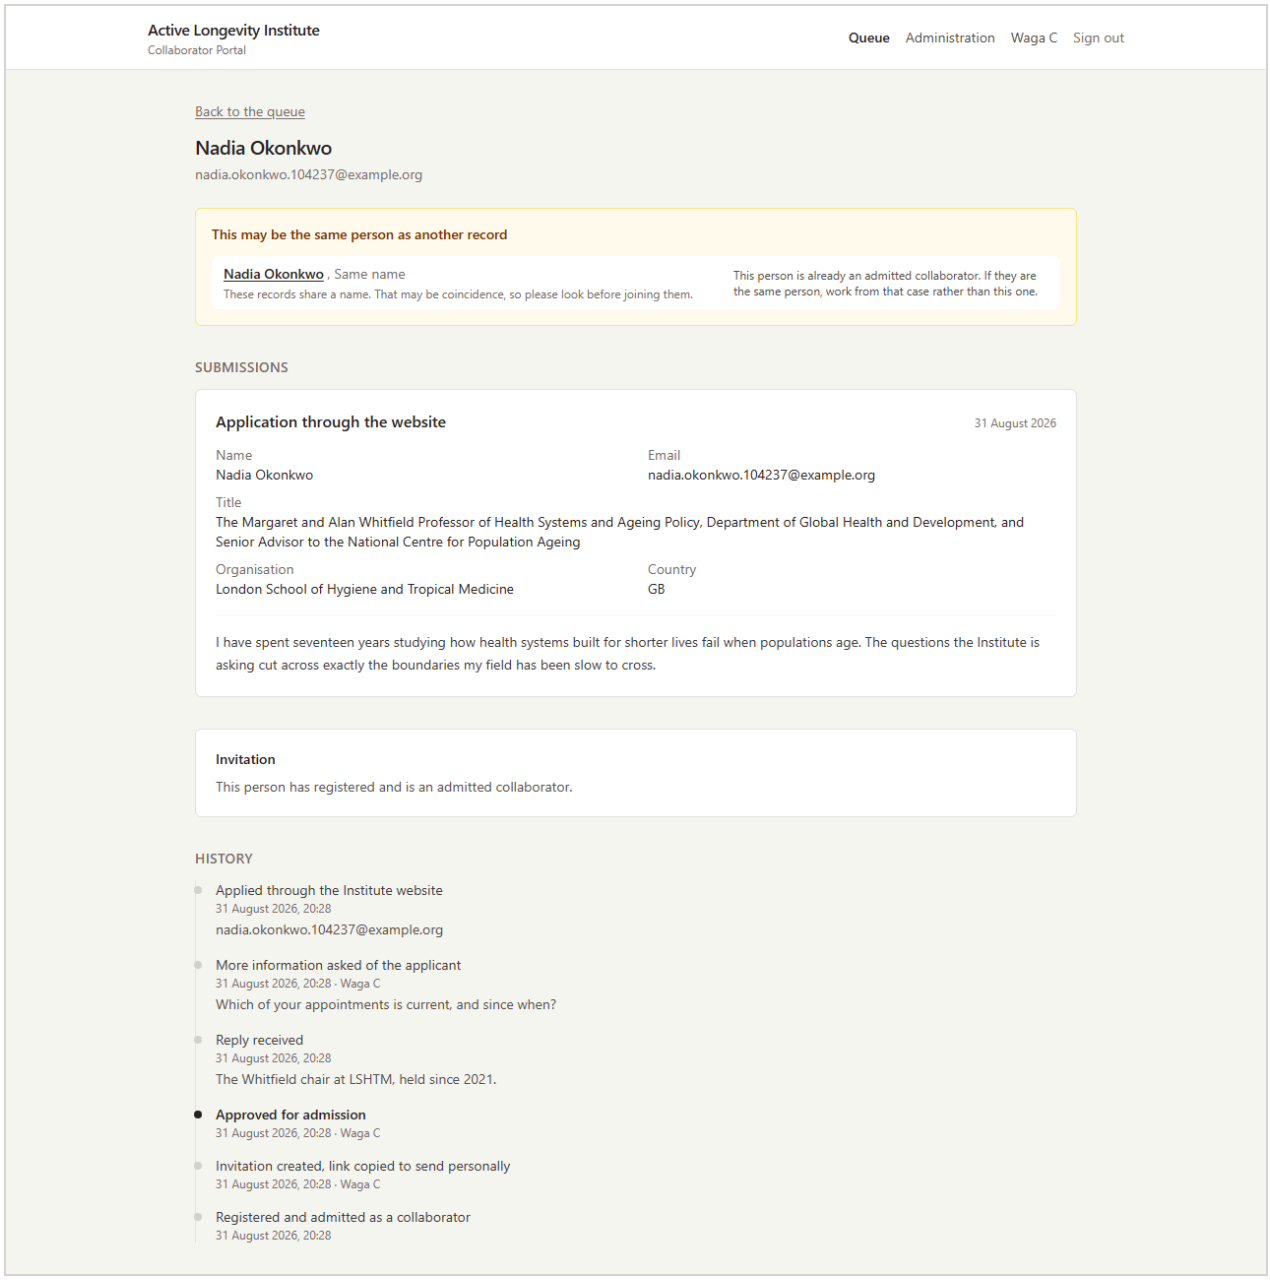

Registration complete. An admitted collaborator now exists.

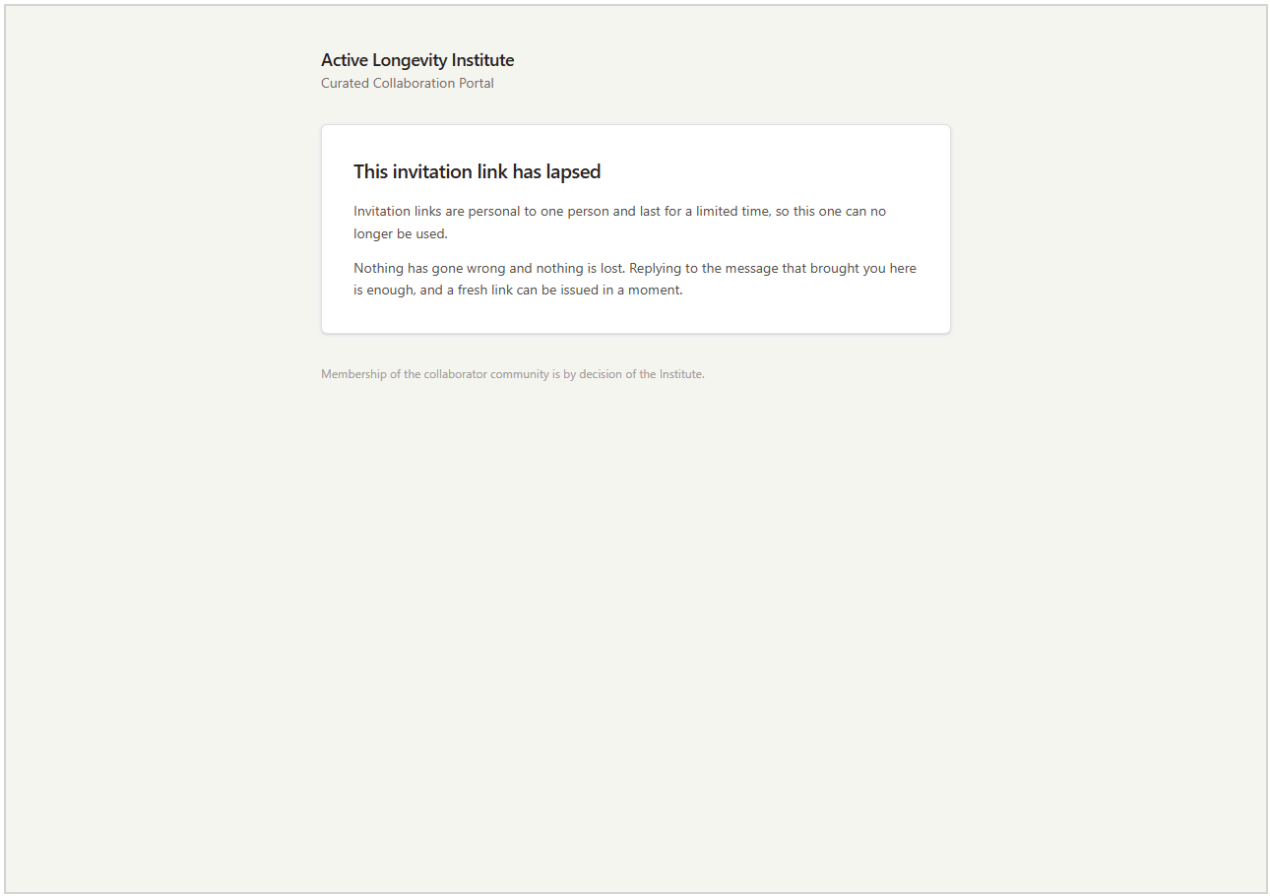

The referral form. The relationship question is required, which is exactly why "Prefer not to specify" is one of the options. The panel states, to the referrer, that these answers are seen by the Institute alone.

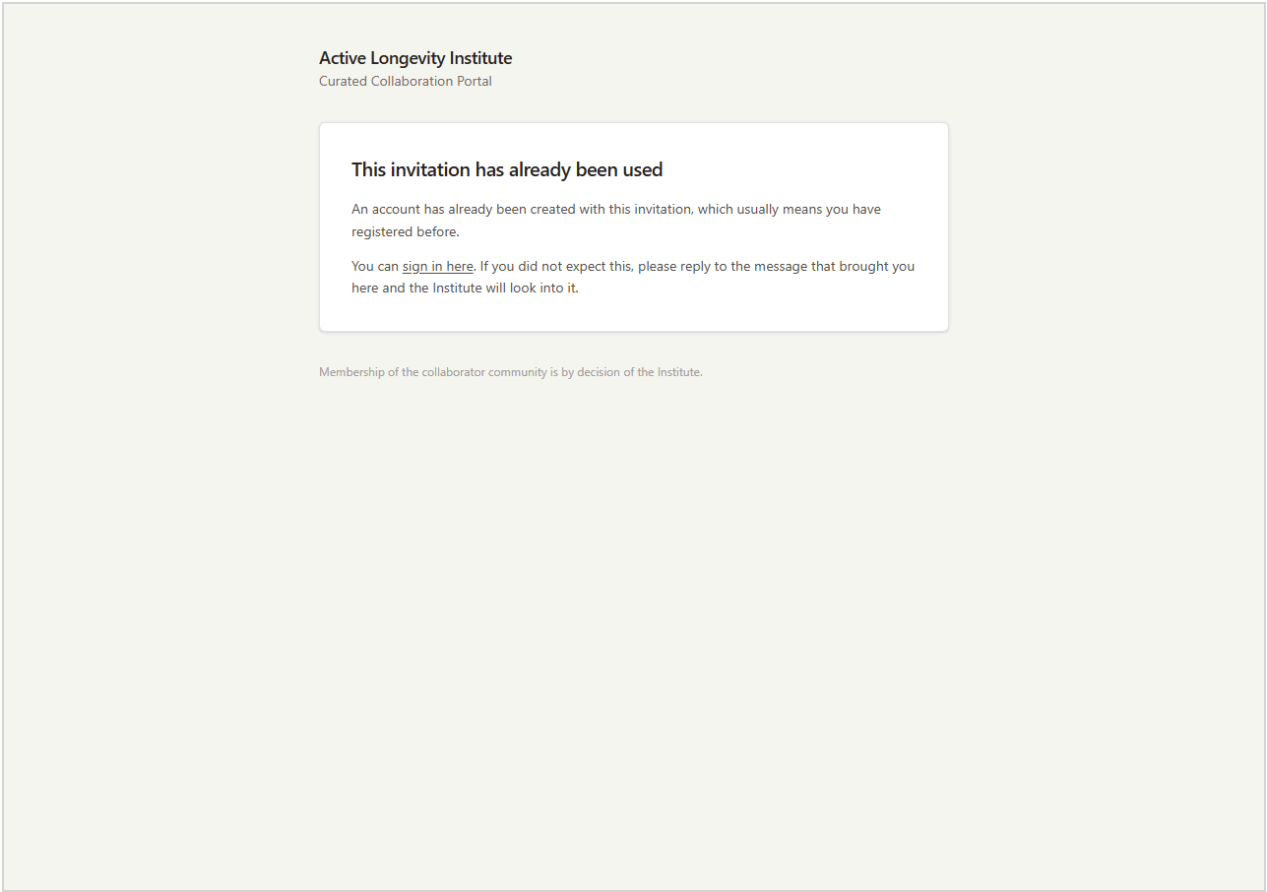

The same referral as the Institute sees it. "I mentored them" rather than a bare "Mentor", because the direction of a mentoring relationship changes how an introduction should be worded.

The complete history: applied, questioned, answered, approved, invited, registered. It is assembled from the records themselves rather than kept as a separate log, so it cannot drift away from the facts it describes.

A link that no longer works. Arriving here is not a mistake the visitor made, so they are never shown an error. An unrecognised link is shown these same words, so nothing distinguishes a wrong guess from a real invitation.

The same link after it was used. Single-use, enforced.

5. Verified by tests

The automated suite — **101 tests, 298 assertions, all passing** — locks in the commitments above so that they are checked on every future change rather than remembered:

- There are exactly four review actions, and only two of them write a judgement.
- A question keeps a case open, may be asked repeatedly, and leaves one decision behind after approval.
- A set-aside case sends nothing, decides nothing, and stays in the queue.
- A question about a referral reaches the referrer; the person recommended is never a contact point during review.
- Declining and setting aside send nothing to anybody.
- The referrer is told when an invitation is issued, once, and never on a reissue.
- Opening an invitation link repeatedly does not consume it; only registration does.
- Lapsed, withdrawn and already-used links are met courteously.

- Two submissions converge only when a person says so; a decided case cannot be joined.
- The database itself refuses a second live invitation for one person, and refuses to email an invitation with no address.
- The greeting is never empty, and a 194-character named chair survives storage whole.
- A complete admission runs end to end, from the website form to an admitted collaborator.

Alongside these: code style, static analysis at level 6, a dependency security audit, and every migration proven to roll back as well as apply.

6. Two things worth knowing

The optional courteous reply on declining an application is not built, deliberately. You described it but had not given final confirmation, and building it unasked would mean the Portal writing to somebody you had chosen not to contact. It waits on your decision and is a small addition whenever you want it.

Where an invitation is sent by copied link, the Portal will show it as issued and later as accepted, but never as delivered, because it did not carry it and cannot see what happened. It will not imply a delivery it cannot observe.

7. Where everything lives

- Staging: `https://staging.portal.activelongevityinstitute.org` — where the screenshots above were taken.
- Production: `https://portal.activelongevityinstitute.org` — the same release, deployed on your approval.
- Repository: `github.com/ActiveLongevityInstitute/active-longevity-portal`, the Institute's own organisation.
- Design package for this milestone: `docs/10-m2-design-package.md`, recording every decision and where it is implemented.

8. Next — Milestone 3: Profiles, Directory and Identity

The collaborator profile, photographs, the community directory and search by name, expertise and country, together with the visual identity of the Portal. It opens with a

design package, which will include the field-by-field visibility table we agreed on 29 August — every field, who may see it, and who decides — for your approval before any code is written.
