Institute Collaborator Portal

Milestone 3 Delivery — Profiles, Directory and Identity · Waga C, Pronto Digital · September 2026

Milestone 2 let a person into the Institute. Milestone 3 gives them somewhere to stand once they are in, and lets the community find them. Everything in it was built from the three Registers the Institute wrote in September, loaded exactly as written, and every screenshot below was taken from the live system.

1. What was delivered

Committed for Milestone 3	Status
Collaborator profiles	**Delivered — title, summary, about, country, links, three positions, credentials, Fields and Specialties; each section saves on its own**
Photographs	**Delivered — center-cropped to one portrait rectangle; format, size and animation enforced by software, the rest by the Institute's eye**
Directory	**Delivered — browse and search by name, expertise at either level, and country; only occupied Fields offered; counts off until they flatter**
Search	**Delivered — search-first selection everywhere, ranked, labeled, alias-aware, punctuation and spelling normalized on both sides**
Visibility	**Delivered — four audiences enforced in one place; the approval table is generated from the enforced rules (section 6)**
Visual identity	**Delivered — the calm institutional treatment applied consistently across every new screen, on desktop and phone**
Three positions per collaborator (approved addition)	**Delivered — structure in Milestone 2, screens here; the limit is enforced by the database**

Credential library (approved addition)	**Delivered — 114 starter records for review; meaning searchable; near matches before a request; three per profile**
Registering an interest in working together	**Delivered — absorbed; what the first Beta uses instead of messaging**
Feedback mechanism before Alpha	**Delivered — absorbed; footer of every page, read in one place**
One-time load of the founding collaborator spreadsheet	**Waiting on the spreadsheet**

2. The Registers, loaded as written

Register	Loaded	Note
Master Field Register v0.2	67 Fields	Including Insurance, Pensions & Retirement Benefits and Housing, added after review
Master Specialty Register v0.1	410 Specialties, 411 Field relationships	13 Specialties span more than one Field, exactly as your section six listed
Master Alias Register v0.1	133 aliases	6 more await the Pensions, Insurance and Psychometrics Specialties still being reconciled
Credential library	114 records	A starter set for your review. FRCP appears three times, by jurisdiction, because those are three different credentials

A Specialty's relationships to its Fields exist for search and discovery only. Selecting a Specialty never assigns a Field, so a journalist who writes about health policy remains a journalist while still being found by somebody searching Public Health.

3. The decisions this milestone implements

Search first, never scroll

Sixty seven Fields and four hundred Specialties are nothing to a search and unbearable as a list, and that is truest on a phone. Every result is labeled Field or Specialty, because similar wording exists at both levels. Ampersands, hyphens and British or American spellings are normalized on both sides, so nobody fails to find a term because of punctuation they did not copy exactly.

No dead end

If no Field, Specialty or credential fits, the collaborator writes the term they use, their profile saves, and they carry on. The term belongs to them while it waits and is offered to nobody else. The Institute decides later: approve, correct the wording first, decline, or match to an existing term. A decision is final.

Credentials are records, not acronyms

MD is Doctor of Medicine in most of the world and Managing Director in others. Because each credential is its own record, the same letters can appear several times with different meanings, and the meaning shown beside each is how a person picks the one they hold. Correcting the wording of one record corrects every profile using it at once.

Admitted is not the same as visible

A profile joins the directory once it carries a name, a title, at least one Field and something in the collaborator's own words. The bar is recognition, not completeness. A profile that is not listable returns not found rather than forbidden, so guessing at addresses reveals nothing about who is a collaborator.

The promise made at collection holds

City and region are collected, shown to the Institute, and never rendered on any profile or directory page. A test asserts this specifically.

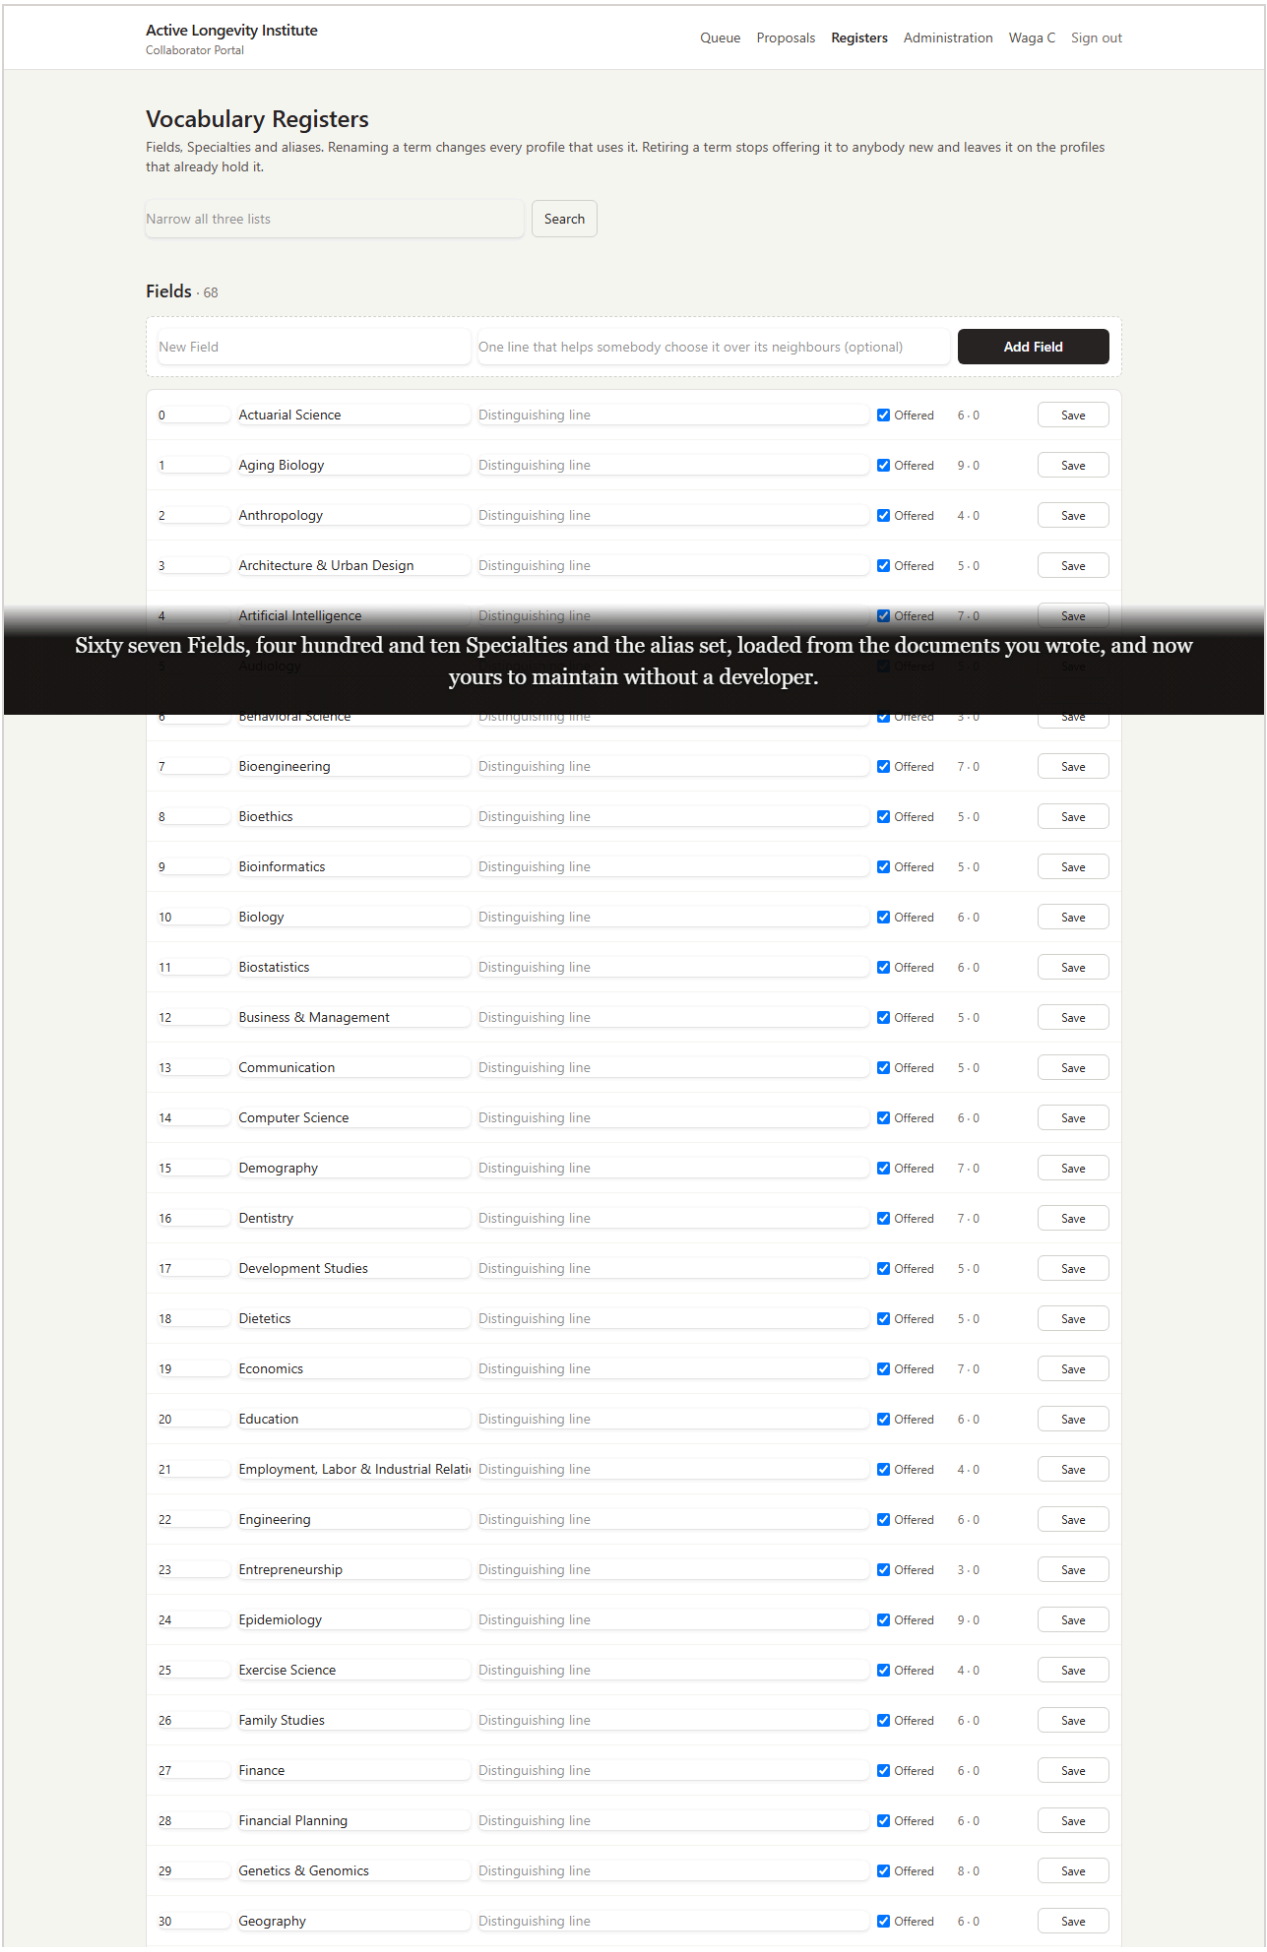

The Institute maintains its own vocabulary

Renaming a term changes every profile that uses it at once. Retiring a term stops offering it to anybody new and leaves it exactly where it is on the profiles that already hold it. Building this exposed a fault in the release process, which would have restored the original wording on every deployment and silently undone any rename. That is fixed, and a test proves a rename survives a release.

4. The walkthrough

A recorded walkthrough accompanies this report: `video/M3-Walkthrough.mp4`, about seven minutes, with subtitles burned in and also supplied as `.srt` and `.vtt`. It follows two collaborators from admission to finding one another, and the Institute deciding a proposed term along the way. It was recorded against the live staging system, not staged.

5. Evidence, from the live system

The Registers screen: your Fields, with the distinguishing lines, ready to be maintained without a developer.

Narrowed to "public": the crowded neighbors, and the line beside each that helps somebody choose between them.

What a newly admitted collaborator now sees: their profile and the community, one click away.

Who you are professionally

Professional title
Professor of Actuarial Science and Longevity Risk, Department of Statistics, and Senior Adviser to the Pensions Regula
Please write it in full. There is room for 300 characters, so named chairs and joint appointments do not need shortening.

One line about your work
How pension systems behave when people live a decade longer than the tables assumed.
This is what appears beside your name in the directory.

About your work (in your own words)
I have spent nineteen years modelling longevity risk for insurers and pension schemes, and increasingly for governments that have discovered the problem is theirs too. I welcome conversations with clinicians and demographers, whose data I rely on and whose assumptions I occasionally test.

This is where the richness belongs. What you work on, what interests you, and what you would welcome a conversation about.

public health ×

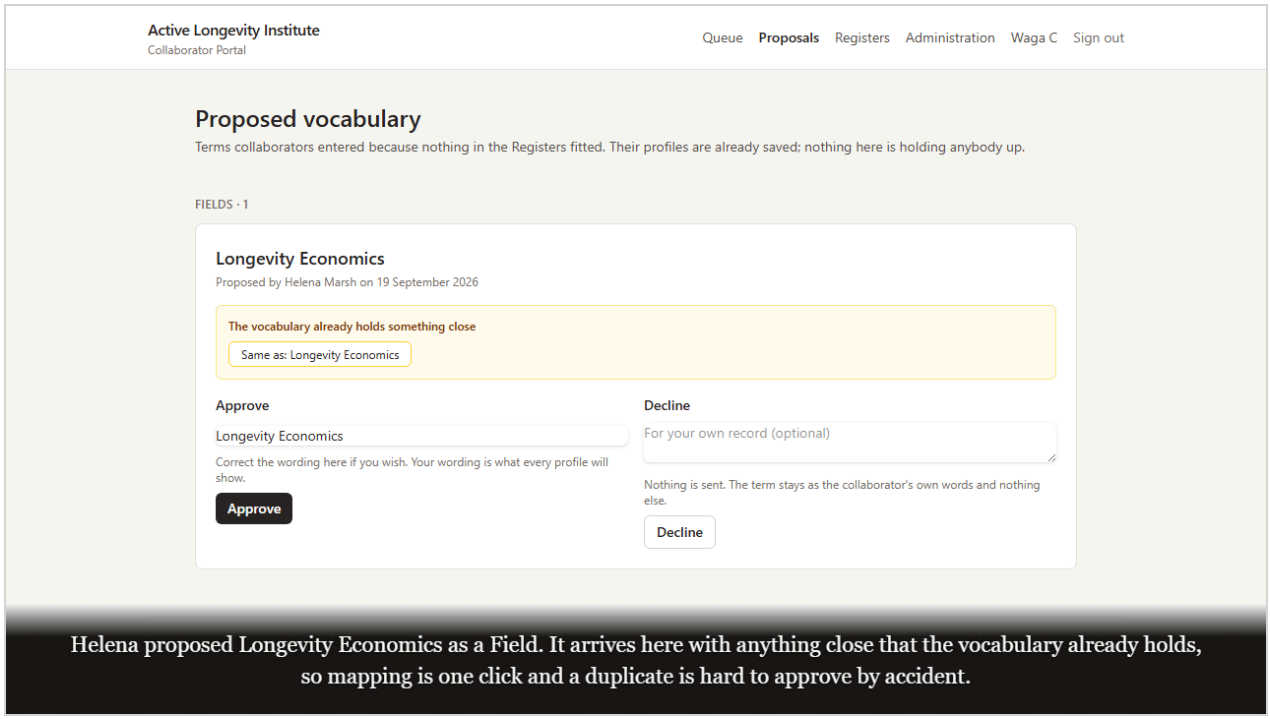

"public health" finds MPH. The meaning is searchable as well as the letters.

The profile as another collaborator sees it. Credentials after the name, the full title wrapped rather than cut, links by label only, and no city anywhere.

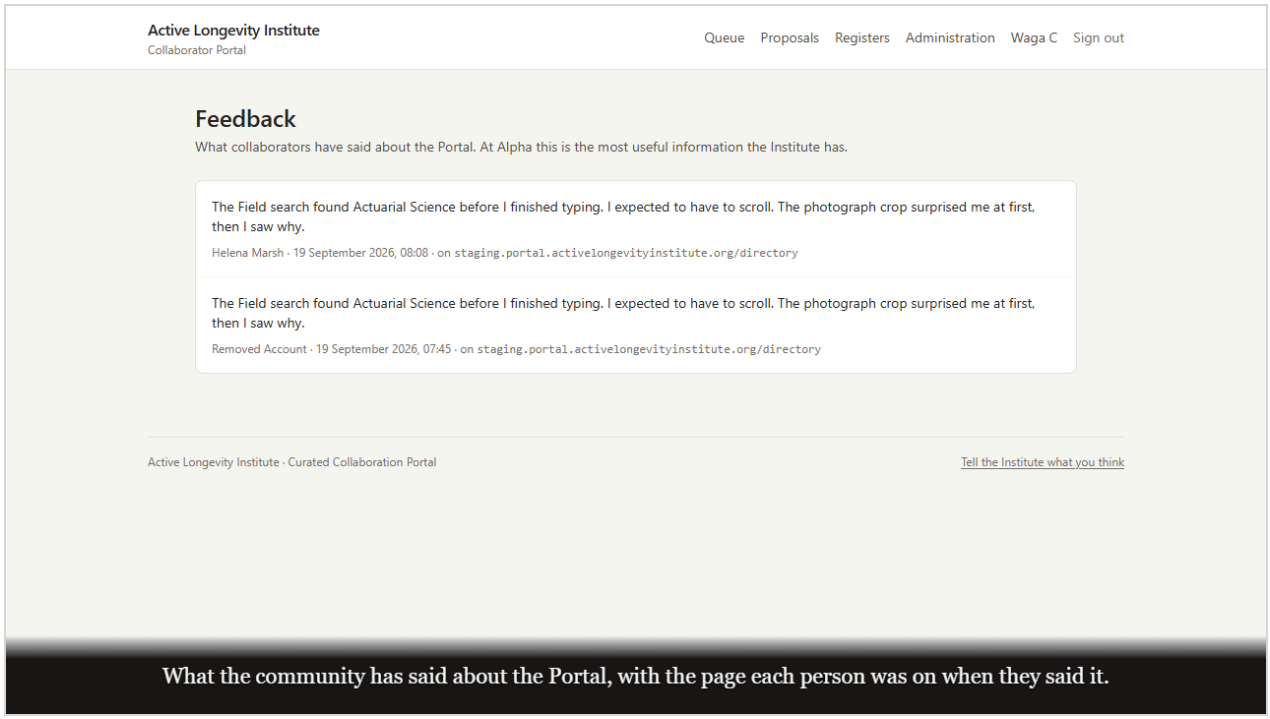

The directory. Only Fields containing somebody are offered; counts are off while the community is small.

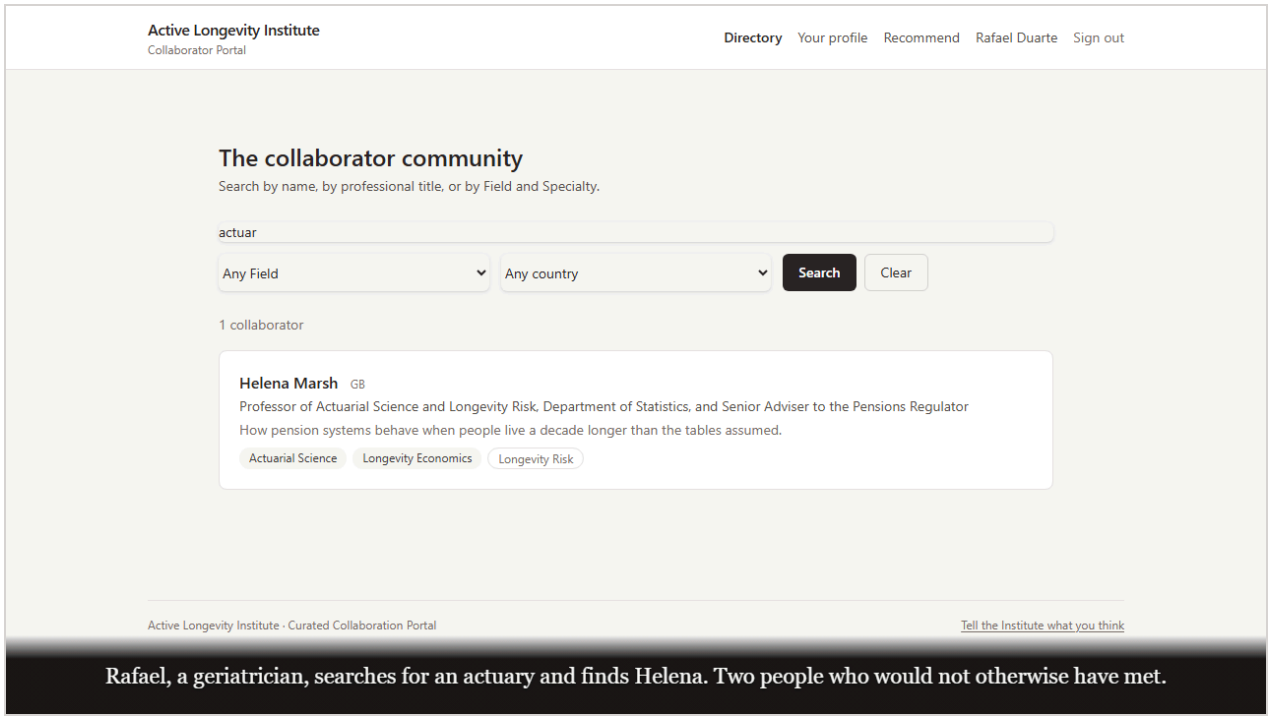

Helena proposed Longevity Economics as a Field. It arrives here with anything close that the vocabulary already holds, so mapping is one click and a duplicate is hard to approve by accident.

The Proposals queue, with near matches the vocabulary already holds and the wording open to correction before approval.

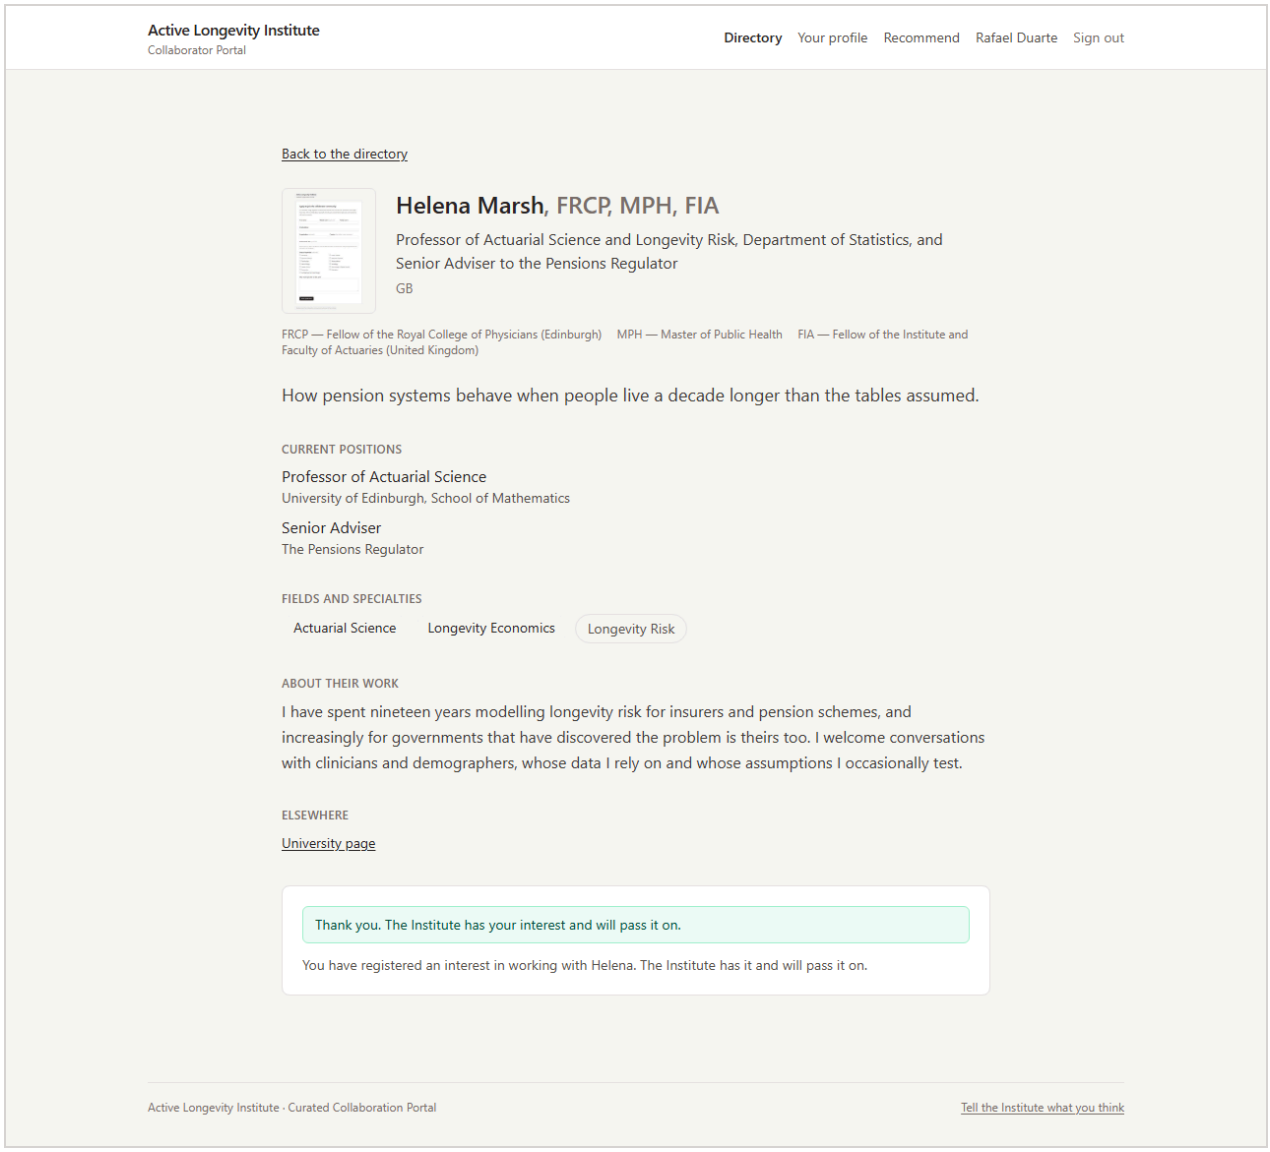

What the community has said about the Portal, with the page each person was on when they said it.

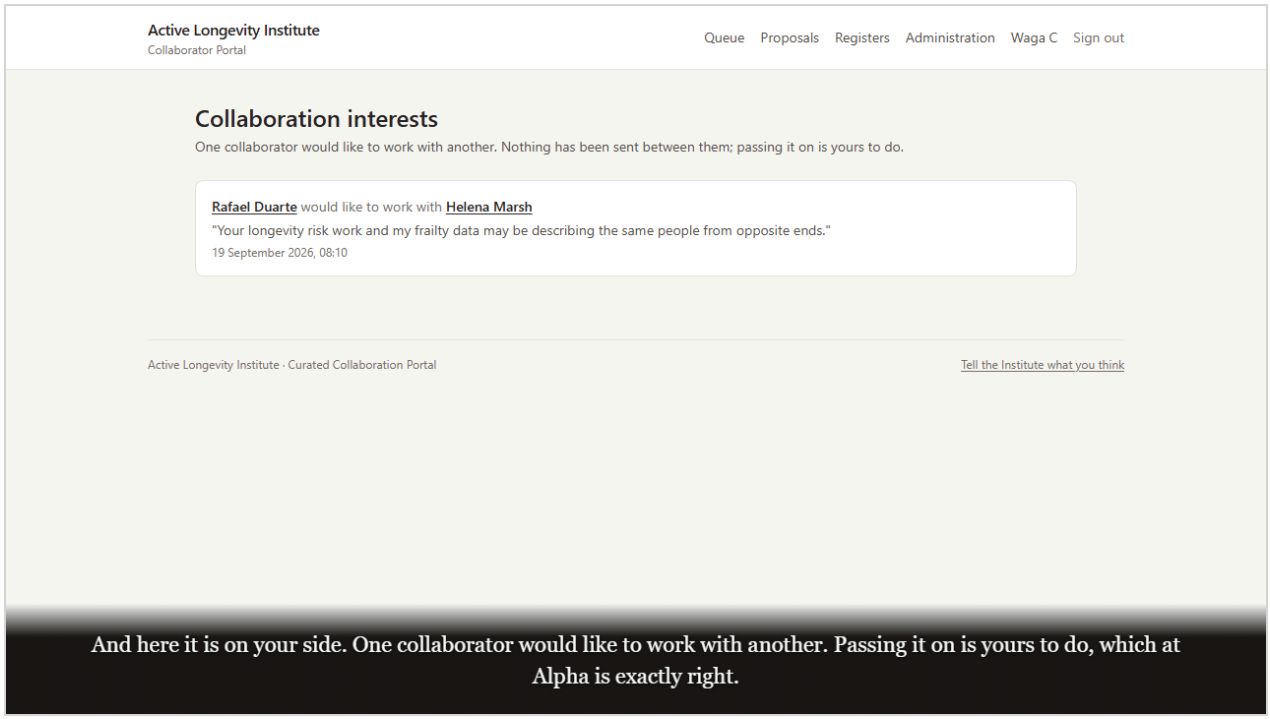

Feedback, read in one place, with the page each person was on.

A geriatrician searches for an actuary and finds her.

An interest in working together, registered once, seen by the Institute, and passed on by hand at Alpha.

The Institute's view of who would like to work with whom.

6. Who can see what

The architecture approved on 29 August, enforced in one place and printed from the same declarations the software obeys, so the written policy and the actual behavior cannot drift apart. Four audiences, most protected first. Nothing is placed in the fourth. A collaborator may always show less than the Institute permits and never more, and every ceiling traces to the promise made when the information was collected.

The full field-by-field table is Appendix A of this report, and is also supplied as a separate document, `Who-Can-See-What.pdf`, for your approval. A field nobody has declared belongs to the Institute alone, and the test suite refuses to pass until somebody states an intention.

7. Verified by tests

193 tests, 606 assertions, all passing, alongside code style, static analysis at level 6, a dependency security audit, and every migration proven to roll back. Among what they lock in:

- The Registers load as written: 67 Fields, 411 relationships, Public Health Nutrition spanning its three Fields.

- Selecting a Specialty never assigns a Field, and a Specialty still makes a person findable under its Fields.
- Narrowing by Field reorders results and never removes any.
- Punctuation and spelling variants find the term; nonsense finds nothing rather than guessing.
- A missing term is recorded without blocking anybody, and is nobody else's vocabulary until approved.
- A fourth credential and a fourth position are refused by the database, not only by the screen.
- City is collected and never published; a non-listable profile is not found rather than forbidden.
- A collaborator may narrow visibility and never widen it; nothing is visible on the open web; an undeclared field fails the build.
- A rename by the Institute survives a release; retiring a term leaves it on existing profiles.
- An interest is registered once per pair, only where accepted, never in oneself; feedback records its page.
- Approving a proposal tells the proposer; declining tells nobody automatically.

8. Three things worth knowing

Two items wait on material from the Institute. The founding collaborator spreadsheet is loaded the moment it arrives. The distinguishing lines for the twenty-nine crowded Fields can be entered in the Registers screen as they are written.

The live servers taught three lessons. Exercising the whole path on the real system before delivery, rather than only in tests, found that the release process would have discarded every uploaded photograph on the next deployment, that the web server had no permission to store one, and that every admitted collaborator carried a hidden directory switch left over from before the directory existed, so a complete profile could be told it was listed while its own page answered not found. All three are fixed: uploads now survive releases, the release itself prepares the storage the web server needs, and a collaborator is listed the moment their profile says enough, with the Institute holding a deliberate switch to withhold anybody. Each has a test or a release check behind it.

Six aliases resolve to nothing yet. They point at Pensions, Insurance and Psychometrics Specialties still being reconciled. The loader skips what it cannot resolve

rather than inventing a target; they begin working when the Specialty Register catches up.

9. Where everything lives

- Staging: `https://staging.portal.activelongevityinstitute.org` — where the screenshots and video were taken.
- Production: `https://portal.activelongevityinstitute.org` — the same release. No collaborator has yet been invited, so nothing is exposed.
- Repository: `github.com/ActiveLongevityInstitute/active-longevity-portal`, the Institute's own organization.
- The vocabulary data: `database/data/expertise-vocabulary.json` and `credentials.json`, loaded on every release, create-only.

10. Next — Milestone 4: Production Readiness and Handover

Hardening, monitoring, documentation, training, a cold-start test proving the system can be rebuilt from nothing, the launch itself, and thirty days of defect support, running while the Alpha group is already inside the Portal and saying what they find.

Appendix A. Who can see what

Printed from the same declarations the Portal enforces, so this table and the live behavior cannot drift apart. Please read it as the policy you are approving.

Four audiences, from most protected to least. A collaborator may always choose to show less than the Institute permits, and never more.

- **The Institute only**
- **The collaborator and the Institute**
- **Admitted collaborators**
- **Anyone on the web**

Nothing is placed in the fourth. It exists so that if the Institute ever decides something should be visible on the open web, that is a setting rather than a rebuild.

The Institute only

Information	Who decides	Why this limit
City	The Institute	Collected as administrative, and said to be so at the time.
State or region	The Institute	Collected as administrative, and said to be so at the time.
Password	The Institute	Stored only as an irreversible hash and never displayed to anybody.
Two-factor secret	The Institute	A security credential, never shown.
How they came to the Institute	The Institute	Provenance is the Institute's record, not a public fact.
Who recommended them	The Institute	Named to the invited person by the Institute if it chooses, never published.
The referrer's relationship to them	The Institute	A private statement by one person about another; seen by the Institute alone, permanently.
How the referrer knows them	The Institute	Given in confidence to inform a decision.

Why they applied	The Institute	Written for the admission decision, not for publication.
Review decisions and reasoning	The Institute	The Institute's own judgments.

The collaborator and the Institute

Information	Who decides	Why this limit
Email address	The Institute	The Portal carries messages rather than displaying addresses. An address never displayed cannot be harvested.
Consent record	The Institute	Theirs to see, and the Institute's to evidence.
Terms they proposed	The Institute	Visible to them while awaiting review, and published only once approved.

Admitted collaborators

Information	Who decides	Why this limit
First name	The Institute	A collaborator is known to the community by name.
Middle name	The Institute	Part of the name of record where a person gives one.
Family name	The Institute	A collaborator is known to the community by name.
Generational suffix	The Institute	Part of the name, held apart so sorting stays correct.
Preferred name	The Institute	Given in answer to how the Portal should address them.
Credentials after the name	The Institute sets the limit; the collaborator may show less	Chosen for display; the collaborator may show none.
Professional title	The Institute	The heart of a directory entry.
One-line summary	The Institute	Written for other collaborators to read.

About your work	The Institute sets the limit; the collaborator may show less	Written for the community; the collaborator may leave it blank.
Organization	The Institute	Professional affiliation is part of standing.
Current positions, up to three	The Institute	Senior people hold more than one appointment.
Fields	The Institute	The directory exists so that people can be found by these.
Specialties	The Institute	Optional precision, offered for discovery.
Links	The Institute sets the limit; the collaborator may show less	The collaborator chooses which to add and in what order.
Photograph	The Institute sets the limit; the collaborator may show less	The collaborator may choose not to publish one.
Languages	The Institute sets the limit; the collaborator may show less	Offered to help collaborators speak to one another.
Open to collaboration	The Institute sets the limit; the collaborator may show less	Entirely the collaborator's own decision.
Country	The Institute	Collected as part of the directory and searchable by it.

Anyone on the web

Nothing. *Deliberately*.

What this guarantees

- A field nobody has declared belongs to the Institute alone, and the test suite refuses to pass until somebody states an intention. The Portal's mistakes err toward privacy.
- Every ceiling traces back to the promise made when the information was collected. A field is never later shown more widely than the person was told when they gave it.
- Enforcement happens in one place rather than page by page, so no future screen can get this wrong by forgetting.
